FINTECH HACKATHON 2026 · HANDOUT

Responsible-AI checklist

Answer each question in one or two lines for your project. Put the five answers on one slide of your Demo Day pitch.

#	Area	Question	Our answer
01	**Explainability**	Can a customer or investigator see why the model decided? What are the top reasons for one real case?	
02	**Fairness**	Did you compare outcomes and errors across groups (gender, age, region)? Could any feature be a proxy?	
03	**Data privacy**	Is personal data minimised and anonymised? Where is it stored? Does any of it go to a service abroad or a free AI tier?	
04	**Model risk**	Honest test on unseen data, a simple baseline, no leakage, a model card and a monitoring plan for drift?	
05	**Human oversight**	Where does a person check, decide or override? What happens when the model is unsure or wrong?	

Georgian rules to check: NBG model risk management regulation for statistical, AI and ML models; NBG responsible-lending limits (PTI, LTV); the AML/CFT law and reporting to the Financial Monitoring Service; the Law on Personal Data Protection (2023). EU AI Act as a reference point: credit scoring of individuals is high-risk.

FINTECH HACKATHON 2026 · HANDOUT

Model card

One page that describes your model honestly. It answers half of the jury's questions in advance.

Section	Example: Nino's credit model (course data)	Your model
Purpose	*Score thin-file applicants for consumer loans up to 30,000 GEL*	What decision does it support, and for whom?
Data	*6,000 synthetic Mtsvane Bank applicants; leakage column removed; gender kept aside for fairness checks*	Source, period, real or synthetic, personal data, known gaps
Method	*Gradient boosting, compared with logistic regression and a depth-3 tree*	Which models you tried and why you chose this one
Performance	*Test AUC 0.78 (Gini 0.55) vs. 0.74 for the simple tree; approval 80% at the most profitable cut-off*	Metric on an honest test set, compared with a baseline
Fairness	*Approval rate 80.0% women vs. 79.9% men; default rates equal*	Outcomes and errors by group
Limits	*Not for business loans or foreign-currency income; synthetic data only*	Where it should not be used, and known failure cases
Controls	*PTI/LTV checks after the score; PD 6–12% goes to an analyst*	Rules, human review and overrides around the model
Owner & monitoring	*Monthly check of default rates, drift and approval rates by group*	Who is responsible, what is monitored, when to retrain
